Booth 3 Project Sound Profile

There was a handout that was a reprint from the Australian Medical Association 2014 position statement on "Wind Farms and Health." noting that "available Australian and international evidence does not support the view that infrasound or low frequency sound generated by wind farms,... causes adverse health effects on populations residing in their vicinity."

However, also stated is the following:

"Individuals residing in the vicinity of wind farms who do experience adverse health or well-being, may do so as a consequence of their heightened anxiety or negative perceptions regarding wind farm developments in their area. Individuals who experience heightened anxiety or diminished health and well-being in the context of local wind farms should seek medical advice."
